A BETTER WAY OF WORKING

A multidisciplinary, multi-agency approach to a young person’s sexual health clinic

Margaret Kingston

Background to the service development
Manchester Centre for Sexual Health (MCSH) and Brook Manchester submitted a successful joint bid for genitourinary medicine (GUM) development pilot funding in 2004 to set up a dedicated young person’s clinic (YPC) at MCSH and establish a nurse practitioner post developing sexual health services at Brook with support from MCSH.

How is the new service organised?
The YPC at MCSH commenced in April 2005. An upper age limit of 19 years was set; those under 16 years are assessed by a health advisor and senior doctor using a young person’s proforma and in accordance with the Fraser Guidelines (a process agreed by the Trust child protection lead). The YPC runs from 3.30 pm to 6.30 pm as a drop-in service accepting patients up to 5.30 pm. A full sexually transmitted infection (STI) screening service is provided and contraception offered when required. The number of patients seen at the clinic has risen steadily since it opened, with 1018 visits (790 new episodes) in the year April 2005–April 2006. The majority of patients are female (74% of attendances) and of these new episodes, 77% were screens. The average age of patients presenting to the service is 18.6 years. STIs are frequently diagnosed, such as vaginal or urethral discharge or warts. Treatment is requested when required. The number of patients seen at the clinic has risen steadily since it opened, with 1018 visits (790 new episodes) in the year April 2005–April 2006. The majority of patients are female (74% of attendances) and of these new episodes, 77% were screens. The average age is 18.6 years. STIs are frequently diagnosed, such as vaginal or urethral discharge or warts. Treatment is

How does the new service work in practice?
On arrival patients complete a simple self-triage form indicating their reason for attending the clinic with brief details of any symptoms. This form is placed at the front of their case notes. Any patient aged under 16 years is seen by the health advisor who makes the initial assessment in line with Fraser Guidelines. Using the self-triage forms the doctors take patients appropriately, with the doctors focusing on those with symptoms such as pelvic pain or genital ulceration and the nurse practitioners those requesting asymptomatic screens or attending as contacts of infection. Both doctors and nurses see those with symptoms such as vaginal or urethral discharge or warts. Treatment is dispensed by all staff members in line with clinic guidelines and nurses administer treatment according to patient group directions. Very young patients or those who have been assaulted are seen by the health advisor and consultant.

What benefits does the new service offer?
This system requires flexibility in patient allocation and cross-referral between staff occurs regularly. We have found that bottlenecks in the system occur infrequently and that patient throughput with this system is efficient. The system also required most staff to be trained in family planning and GUM. This new way of working in our department and with our Brook and PHDS colleagues has proved a success that we hope to continue to build upon in the future.
