Involving pharmacists in sexual health research: experience from an emergency contraception study

Kirsten Black, Claire Anderson, Ali Kubba, Kaye Wellings

Abstract

Background Community pharmacists are expanding their sphere of activity within primary health care, increasing their role not only in health care but also research.

Methods and results We describe the challenges encountered in carrying out a pilot study of women obtaining emergency hormonal contraception through different providers, including pharmacies, highlighting deficiencies in understanding and experience of the research process, which impacted on the study in substantial ways.

Introduction

Pharmacists can make an important contribution to public health by improving access to emergency hormonal contraception (EHC).1 UK health authorities saw the Crown report’s recommendation regarding introduction of patient group directions (PGDs) as an opportunity for community pharmacists to supply EHC free of charge.2 This was supported by funding from Health Action Zone (HAZ) schemes, set up in areas of deprivation across the UK to address health inequalities,3,4 which encourage health care providers to find innovative and collaborative ways of increasing health gain.5

In January 2001, following establishment of the PGD schemes, levonorgestrel EHC (Levonelle®) was deregulated to a pharmacy (P) status in the UK and became available in all community pharmacies. The PGD services provided EHC free of charge, while other pharmacies charged a fee (£24.99 in 2008). Since deregulation, women have shown increasing preference for pharmacy over clinical provision of EHC.6 The expansion of pharmacists’ roles into sexual health has been accompanied by research involving pharmacists to recruit women at the time they presented.7

Methods

We describe the challenges encountered in carrying out a pilot study of women obtaining emergency hormonal contraception through different providers, including pharmacies, highlighting deficiencies in understanding and experience of the research process, which impacted on the study in substantial ways.

Methods and results

Education needs to prioritise the research component of pharmacy practice. By increasing awareness of the potential of research to benefit patients and by raising the profile of research in pharmacy practice, pharmacy education can encourage pharmacists to participate in research.8

Conclusion

As pharmacists expand their role, training and professional development will need to be enhanced to support them in their contribution to health care and research.

Keywords community pharmacist, emergency contraception, pharmacy education, pharmacy research

(Accepted 24 June 2008)

Key message points

- Whilst pharmacists are rapidly expanding their clinical knowledge and skills, there has been less focus on developing competency with research.
- The experience of working with pharmacists to undertake a study of emergency hormonal contraception services revealed a willingness amongst pharmacists to participate in research but a lack of familiarity with the research process, which impacted on recruitment.
- Researchers need to be aware of the difficulties facing pharmacists in carrying out research. Professional education needs to prioritise the research component of pharmacy practice.

In this paper we describe some methodological difficulties encountered in a pilot study investigating women’s experience of obtaining EHC through pharmacies and clinical services. We discuss how these difficulties threatened continuation and validity of the research to help mitigate the risk of similar problems impeding future research in this important area.

Emergency contraception study

The methodology of this pilot study is described fully elsewhere.11 We recruited a cohort of women obtaining EHC through two types of services between 2002 and 2003 in the inner city South London boroughs of Lambeth and Southwark, with the aim of investigating short-term impact within different service models. We asked medical staff and pharmacists to recruit women at the time they presented. Willing volunteers recorded their contact details on an information sheet and were contacted and interviewed 4 months later. Of the five pharmacies taking part in the study, two were involved in the HAZ scheme and three were selling EHC over the counter (attendance was lower at these premises compared to the HAZ pharmacies).2 Pharmacists were paid for their time and none refused involvement.

Methodological issues

Many of the pharmacists were familiar with audit, but few had participated in clinical research. A key challenge related to sample recruitment and response rates. We could not recruit directly from HAZ pharmacies as the contract held with local health authorities prohibited third-party disclosure of information. Instead the pharmacists themselves agreed to recruit on our behalf. However, most were unable to record numbers approached to participate.
because of the demands of business and so we had no
denominator for the response rate.

A second difficulty related to speed of recruitment. In
pharmacies selling EHC over the counter, study enrolment
was slow because fewer women were buying from this
source. The HAZ pharmacies, by contrast, were extremely
busy, yet in one case recruited few women. The lead
pharmacist admitted his discomfort with the interaction
around EHC, particularly in dealing with the younger
women, and was reluctant to request participation in the
research.

A third challenge related to confidentiality and we
encountered one serious breach thereof. Despite having
been briefed on the importance of ensuring confidentiality,
and the importance of storing volunteer details behind the
counter, staff in one pharmacy placed the box containing
names on the counter, believing that women were more
likely to volunteer if they felt they were not been
scrutinised. On one occasion, a box containing details of up
to 10 women went missing. The pharmacist notified the
police and we notified the ethics committee and temporarily suspended the study at all sites pending
investigation. The committee’s recommendation, that the
boxes be fixed to the counters at each of the sites, was not
considered feasible but we proposed instead that the
pharmacists should sign a document stating that the patient
details would be kept locked away at all times, and that
none would be left in a public area. All participating
pharmacists agreed to this and the ethics committee
consented to the continuation of the study, but some
momentum was lost. Supported by advice from a
statistician, we decided to cease recruitment at 50 women.

Ethical approval
Ethical approval for this study was granted by Guy’s and St
Thomas’ Research Ethics Committee.

Discussion
This paper illustrates some of the challenges involved in
undertaking sexual health research in pharmacies. The
findings of the study, reported fully elsewhere, suggested
that women experienced less privacy and comfort in
pharmacies compared with those attending a clinical
service.11 This may also have impacted on the research
process. Lack of experience of, and familiarity with, the
research process led to difficulties of confidentiality and
recruitment.

These challenges apply to all health care providers, but
are exacerbated in the context of pharmacies by commercial pressures.12 There will inevitably be
incompatibility between the requirements of running a
business and carrying out research. Further, at a time when
pharmacists were grappling with the relatively new
responsibility of EHC supply, taking on additional
responsibilities of recruitment for research may have
seemed overwhelming.

As researchers, we had not adequately anticipated the
difficulties of maintaining control over the research
process, of ensuring patient confidentiality, and of
achieving compliance with the research – all of which have
been reported by others.13 Studies of emergency
contraception undertaken in pharmacies have routinely
achieved response rates lower than 10%.14–17 This and
has similarly been attributed to moral opposition to EHC,
time constraints, sensitivity of the issues, and unwillingness to add to the administrative burden.

Despite the difficulties, the benefits of academic research in community pharmacies can be reciprocal.
Members of a community pharmacy research network
established in the North of England reportedly enjoy the
exposure to different research methods, and believe that
involvement in research improves their relationships with
customers and the advice they give.18 Alongside the
expansion of pharmacists’ responsibilities,19 professional
development programmes have been set up to update them
on the changing needs in pharmacy practice and to develop
their clinical skills. Pharmacists are developing a broader
understanding of the research process and how to interpret
research findings and translate them into clinical practice.20 Practical issues, such as lack of privacy, are
being addressed. A new contractual framework for
pharmacists includes provision of a consultation area as a
specification for many services and as many as 75% of
pharmacies now provide a private area.21

It will take time for the necessary training in research
methods to be implemented, and to influence practice.22
Meanwhile, researchers need to ensure that the process is
as convenient as possible, that it does not conflict with
commercial goals, that the necessary equipment is
provided, and that time is spent fully briefing pharmacists
on the rationale for the procedures used. We hope that the
lessons we learnt in the course of this study may benefit others.

Acknowledgements
The authors wish to thank the study pharmacists for their
involvement and Beth Taylor and Tony Carson for their guidance.

Statements on funding and competing interests
Funding Dr Kirsten Black was granted a Research Training
Fellowship from the Guy’s and St Thomas’ Charitable Foundation
to undertake this study as part of a PhD. Schering Health Care
contributed funds for the consumable costs of the study.

Competing interests
None identified.

Involving pharmacists in sexual health research/Faculty awards

The Faculty of Sexual and Reproductive Healthcare has available a number of annual awards for which applications are invited from Faculty members and non-members. Details of the individual awards, together with an application form and/or guidelines on how to apply and any eligibility criteria, may be found on the Faculty website at www.fsrh.org.

Margaret Jackson Prize Essay

The Faculty will award three prizes annually in memory of Dr Margaret Jackson, a distinguished pioneer in the field of family planning. These prizes are awarded to undergraduates who write the three best essays on a topic related to reproductive health care or fertility control. The first prize is £300, with £100 each for the two runners-up. Entries should not exceed 3000 words.

Eligibility: Individuals (undergraduate medical students)  
Closing date: 24 March annually

The David Bromham Annual Memorial Award

David Bromham was the first Chairman of the Faculty of Family Planning and Reproductive Health Care (as the Faculty was then known). Sadly, halfway through his second term of office he became ill, and in 1996 he died. His loss was tragic, not only for the Faculty, but for the family planning movement in Britain and worldwide. Whilst in Leeds he set up an assisted conception programme, which was and is one of the most successful in the world. In 1991 he set up a fertility control unit designed to provide a more accessible service for the termination of pregnancy. He also carried out an extensive programme of research and was closely involved with the British Journal of Family Planning (now the Journal of Family Planning and Reproductive Health Care).

The Award is not intended to be a prize for a long and distinguished service, rather for a piece of work which through inspiration, innovation or energy has advanced the practice of family planning and reproductive health care in any way and any setting. It is not a research grant. Younger health professionals sometimes undervalue their achievements but they are exactly the people that David Bromham would have wished to see encouraged as this award now acknowledges.

The award will be made either to an individual (who must be a current Diplomate, Member or Fellow of the Faculty) or to a team, which could be multidisciplinary. In the latter case, the lead doctor should be a current member of the Faculty. You may nominate yourself or your team or be nominated by someone else.

Eligibility: Individuals (Faculty members) or teams  
Closing date: 7 April annually

International Travelling Scholarship of the Faculty

The Faculty offers a scholarship for those Faculty members who are interested in going abroad to visit international colleagues, services, research or educational establishments in order to learn about some aspect of family planning or reproductive health care. The award will be for a maximum of £2000. The recipient of the award will be required to give a presentation at a Faculty conference.

Eligibility: Individuals (Faculty members)  
Closing date: 7 April annually

The 4-0-8 Sheffield Fund

In 2001, the 4-0-8 Young People’s Consultation Centre Ltd, Sheffield made a significant donation to the Faculty for the purpose of funding training for health care professionals who have limited funding for attending training meetings. Any person working in the field of reproductive and sexual health care within the UK may apply. Approximately £4000 is allocated annually, divided between the successful applicants.

Eligibility: Individuals (Faculty members/non-members)  
Closing date: See website for details
