could contribute its greatest public health benefit in this
time.9 Our respondents, however, did not agree, wanting
the pharmacy experience to be as brief as possible and
not wishing to be counselled about STIs and/or regular
contraception by the pharmacist unless they request it.

Conclusions

In conclusion, these results confirm views from other
studies on this issue, which suggest that although women
have some concerns in relation to OTC supply of the ECP,
they believe that its deregulation is a positive step as it
improves women’s access to it. The data also suggest that
women need to be provided with more information and
education in relation to the ECP, as this is critical in raising
awareness about a subject which has been described as “the
best-kept secret in contraception” (p. 729).29

Acknowledgements

The authors would like to thank the women who participated in the
study and shared their views. They would also like to acknowledge
the staff at Family Planning Victoria, Brisbane, Darwin and
Newcastle and the staff at the School of Nursing and Midwifery and
School of Physiotherapy, La Trobe University, Melbourne who
helped with recruitment and provided a venue for focus groups.

Statements on funding and competing interests

Funding This study was funded by an Australian Research
Council (ARC) Linkage Grant.

Competing interests None identified.

BOOK REVIEW

Successful Scientific Writing: A Step-By-Step Guide for the Biological and Medical Sciences (3rd edn). Janice R Matthews, Robert W

I really enjoyed reading this book. It is a handy book with all the necessary chapters and exercises to train undergraduate and postgraduate candidates in biomedical sciences in the art of scientific writing. I am sure clinicians will also find the book very helpful, although they would need to access local information sources and databases to gain maximum benefit.

The spiral binding makes it easy to read and carry around. The eight chapters flow easily from conception of a topic, through the research, the writing process and the possible ethical and legal pitfalls one may encounter when submitting a piece of scientific writing for publication. There is a chapter on improving word choice and syntax that will help immensely in improving the readability and appeal of written material.

Throughout the book, the authors have emphasised the need for planning and organisation, whether drafting, writing, presenting or publishing the material. In particular, they give sound advice on how to avoid even accidental plagiarism. I enjoyed doing the exercises after each chapter although the temptation to look at the answers was great! Postgraduate medical trainees who want to use this book as a guide will benefit from involving a clinical librarian to ensure they use the appropriate databases and search strategies for their research.
